

The FCC has no jurisdiction over the internet and there is no constitutionally sound way to change that. The regulation of internet communication is unwarranted, wrong-headed, and technically impossible. Consider that the internet is used to conduct business transactions - and those transactions must be protected from interception by criminal parties in between the buyer and seller. That protection is established by encryption and there is no reliable way to tell what is in that communication without knowing the key. Key escrow is not an option due to inevitable misuse and/or corruption.

Any amount of computing power can be thrown into protecting the privacy of communication, and it will take orders of magnitude more to break such privacy. Please, do NOT start an encryption arms race, it will waste immense amounts of computing power that humanity needs for other purposes. Don't waste taxpayer money trying to do the impossible, especially as it is a violation of the right to free speech to do so.
